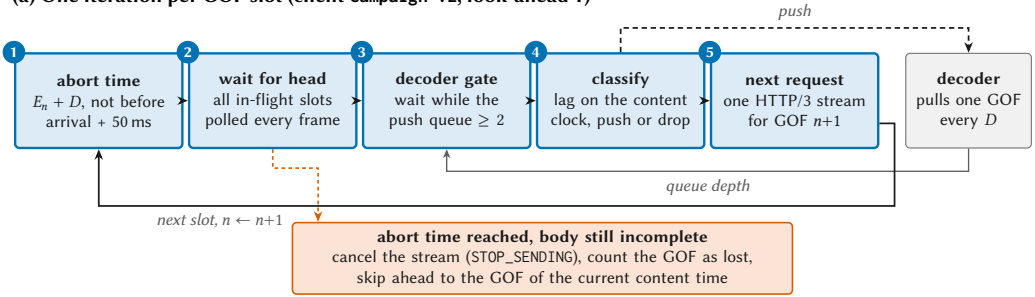
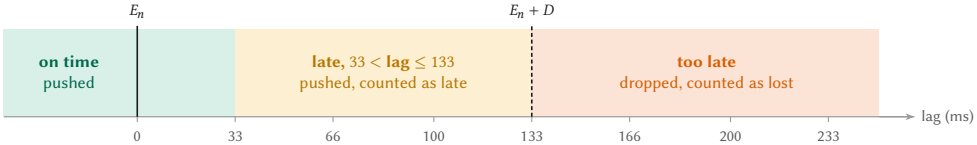
(a) One iteration per GOF slot (client `campaign-v2`, look-ahead 1)



(b) Classification of a complete GOF by its lag after $E_n = T_a + n\,D$



D = 133.3 ms (4 frames at 30 fps). T_a is the first successful push; before it nothing can be late, and the 2.5 s start-up abort applies. Lag is quantized to the Unity frame (≈ 30 ms), so on this client a fetch must finish within about three frames (90 ms) to stay on time.
