
1 GSO bursts reordered packets and caused spurious losses. **2** Twelve TX queues spread one flow and reordered it. **3** netem without a TBF parent under-drops. **4** A bucket smaller than one packet caused overlimits on the delay chains. **5** The default netem queue (1000 packets) overflowed at 20 ms. Impairment acts on the server-to-client direction only. Measured effects: see the confounds table.
